I've been programming for about 5 years and today I Googled 'how to transpose a dataset', because I hadn't done it for 2 weeks and couldn't remember . . . Coding isn't about memorising; if it was, I definitely wouldn't have a job

Hello, my name is Graeme, I have a PhD in computing, and I am a senior accessibility consultant, but when I want to type "é" on a Windows laptop I go to Beyoncé's Wikipedia p. and copy/paste the letter from there

@EKaleEdmiston

A friend/colleague who is an excellent programmer offhandedly told me the other day that coding is 90% Googling error messages & 10% writing code.

@AstroKatie

A surprisingly large part of having expertise in a topic is not so much knowing everything about it but learning the language and sources well enough to be extremely efficient in Google searches

I was just asked whether I ever have to look things up when I code. I want to go on record saying that, aside from canned white board coding examples, I can't write two lines of code without referring to Google or stack overflow. I would be lost without them
